Hydraulic Motor with Roller-bearing Crankshaft & Connecting-rods

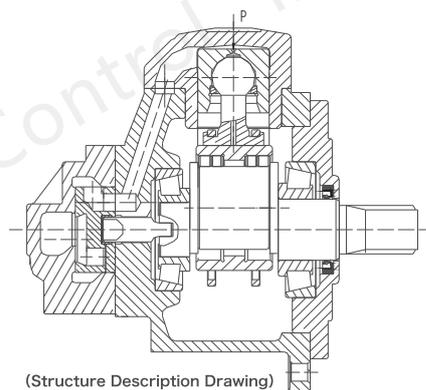

## NHM SERIES HYDRAULIC MOTOR

### PRODUCT FEATURE

NHM Series crankshaft connecting rod type low-speed high-torque hydraulic motor is produced in accordance with the technology and design from Italy. On this basis, continuous improvements have been made in technologies according to the local market demands to suit the needs of customers.

Main features of the design include:

1. Low noise output due to the eccentric shaft and five-piston structure with lower vibration frequency characteristics;
2. The high start-up torque and low-speed stability resulting in the smooth running of the motor at low speed;
3. Strong reliability and less leakage due to the patented plate compensational oil distributor design. Special sealing ring between piston and cylinder guarantees high volumetric efficiency;
4. High mechanical efficiency due to the roller design between the crankshaft and connecting rod;
5. With the reversible direction of rotation, the output shaft can endure certain external radial and axial forces;
6. High power-mass ratio relatively small volume and weight.

### INTRODUCTION OF DESIGN

Hydraulic fluid enters into the swivel cylinder cavity through the oil distribution valve and generates thrust on the pistons. Such thrust acts directly on the center of the spherical crankshaft. As the force and direction of the thrust generated by each piston is different, the crankshaft rotates under the combined forces and drives the oil distribution valve to rotate synchronously with the connecting rotation mechanism. When a typical piston reaches the bottom dead center, the piston is connected to the oil circuit (return port) through the oil distribution valve, and the piston is thereby pushed up by the crankshaft. At this moment, the pressurized hydraulic fluid after work returns to the oil tank through the oil distributor. Each piston is alternately connected with high and low pressure hydraulic oil at each work cycle, and the driving torque generated by each piston to the crankshaft center is superimposed in the same direction, so that the motor output shaft obtains continuous and stable turning torque. When the direction of oil flow is reversed, the direction in which the motor rotates will then be reversed. Alternatively, if the oil distribution valve plate is assembled by turning 180°, the motor shaft rotation direction will also be reversed.

### CALCULATIONS & FORMULAS

1. The actual output torque of the hydraulic motor:  $M=0.159 ( P_1-P_2 ) V \cdot \eta_m ( N \cdot m )$

Where:  $P_1$ 、 $P_2$ -----Inlet and outlet pressure (MPa)  
 $V$ ----- Displacement (ml/r)  
 $\eta_m$ ----- Mechanical efficiency (%)

2. Output power of the hydraulic motor:

$$N = \frac{M \cdot n}{9550} ( kW ) \quad N = \frac{q ( P_1 - P_2 )}{60000} ( kW )$$

Where:  $n$ ----- Rotation speed (r/min)  
 $q$ ----- Input flow (ml/min)  
 $\eta_v$ ----- Volumetric efficiency (%)

3. Rotating speed of the hydraulic motor

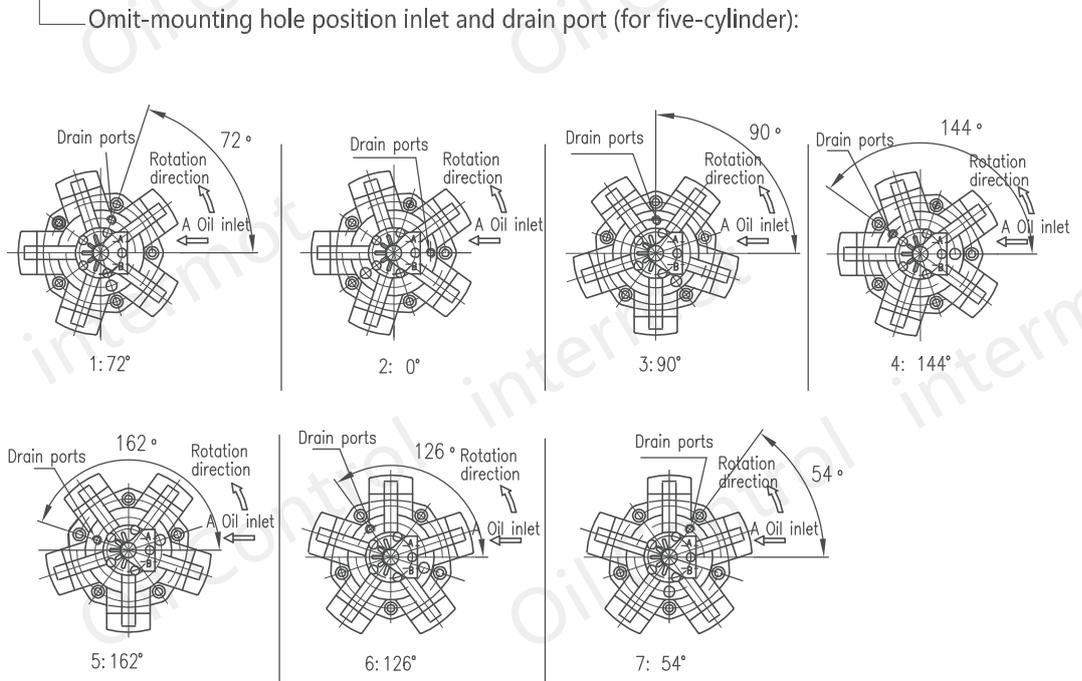

$$n = \frac{q}{V} \eta_v ( r/min )$$

### INSTRUCTIONS & ADVICES

1. Filtration: The recommended filtration precision for normal industrial application is 25  $\mu m$ , and allowable precision is 75  $\mu m$  under low-pressure low-speed or interval working conditions.
2. Viscosity: The optimum performance could only be obtained in the good viscosity condition and therefore in most conditions, the viscosity of the motor should be within the range of 15-1000 cst.
3. Before the first time start-up, the hydraulic motor must be filled with hydraulic oil to prevent damage.
4. Leakage: The drain port should be separately connected to the tank. Oil drain pipe should be installed below the oil level surface of the tank. Normally, the allowable maximum pressure for the motor body is 0.1 MPa.
5. The highest horizontal level of the drain pipe should be higher than the highest horizontal position of the motor housing to prevent the emptying oil storage.
6. The hydraulic motor can be installed in any position with rigid support. During the installation, ensure that the drive shaft of the hydraulic motor and the output shaft of the hydraulic motor are concentric.
7. Strictly ensure the cleanliness of the oil port connection, and keep away any solid particles.
8. Release both the radial and axial loads of the output shaft to enable the longer life of the motor.
9. The type of motor cannot work as a pump.

## ORDERING CODE

1 2 3 4 5 6

Omit-mounting hole position inlet and drain port (for five-cylinder):

Unless specified, the standard configuration is applied (see installation connection dimension drawing of motor, refer to page A20)

Form of an output shaft

Standard rectangular spline shaft without letters (Centering with the outer diameter).

"B" represents a Parallel key shaft, and the footnote numbers indicate the same installation dimensions of the corresponding models of the same Orbit motor or other brand hydraulic motors (with flange)

"I" represents internal spline (centering with the interior diameter), and the footnote numbers indicate the same installation dimensions of QJM series (with flange)

"GM" and "SL" represent the installation connection dimensions are the same as those of SAI Italy M series, L series and GM series hydraulic motors, and the footnote number refers to the relevant installation dimensions

(For more detailed data & dimensions, please consult our engineer)

Nominal displacement (ml/r)

Serial Code

NHM Series Identifier: (Intermot crankshaft connecting radial piston hydraulic motor)

NHMS Series special edition with enhanced rotation speed performance

### MODEL EXAMPLE:

NHM6-450B-D31 (G3/4")\72

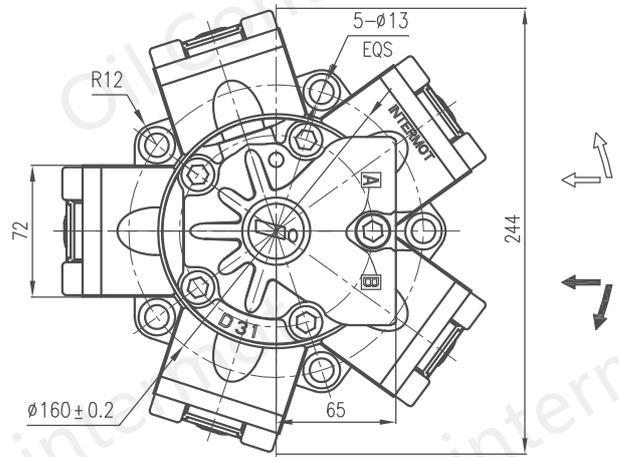

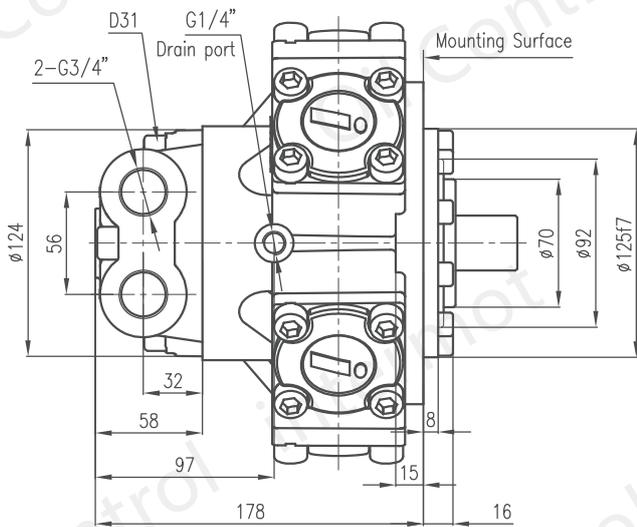

Represents NHM6 series radial piston hydraulic motor with crankshaft connecting-rod structure, displacement: 450 ml/r, output shaft: B (Parallel Key), and oil distributor: D31 (G3/4"), the relative mounting position of oil inlet and drain port is 72°.

## TECHNICAL PERFORMANCE PARAMETERS

Type	Displacement (ml/r)	Rated Pressure (MPa)	Max. Pressure (MPa)	Rated Torque (N.m)	Unit Torque (N.m/MPa)	Speed (r/min)	Weight (kg)

## DISTRIBUTOR

### STANDARD DISTRIBUTOR

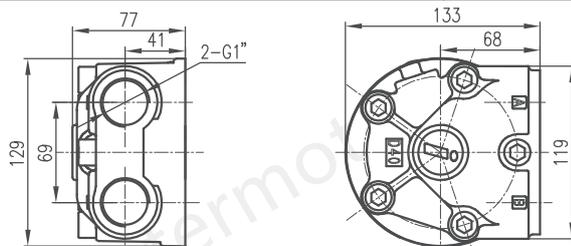

D31

Distributor with 3/4" ports for NHM1\NHM2  
\NHM3\NHM6 series motors

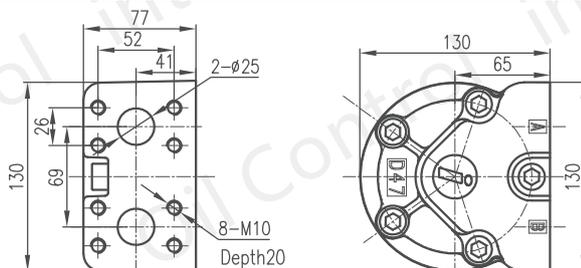

D40

Standard distributor for NHM8\NHM11 and  
small motors in the condition of high speed

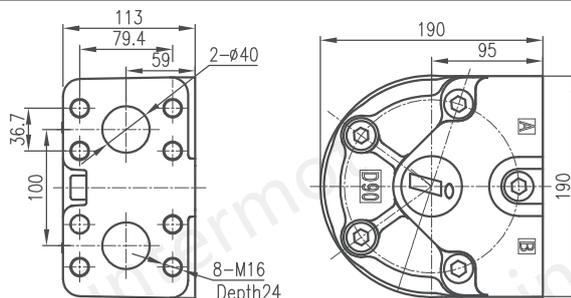

D47

Distributor with  $\varnothing 25$  flanges for NHM16 series motor

D90

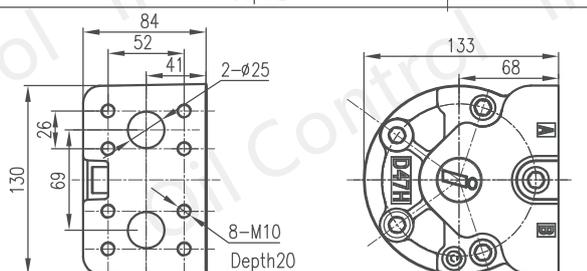

Large flow distributor for NHM31\NHM70 series motors

### DISTRIBUTOR WITH FLUSHING

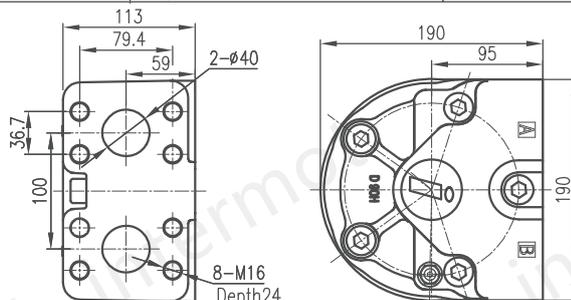

D47H

Distributor with  $\varnothing 25$  flanges for NHMH6\NHMH8  
\NHMH11\NHMH16 series motor  
( Only for one-way rotation )

D90H

Large flow distributor for NHMH31\NHMH70 series motors  
( Only for one-way rotation )

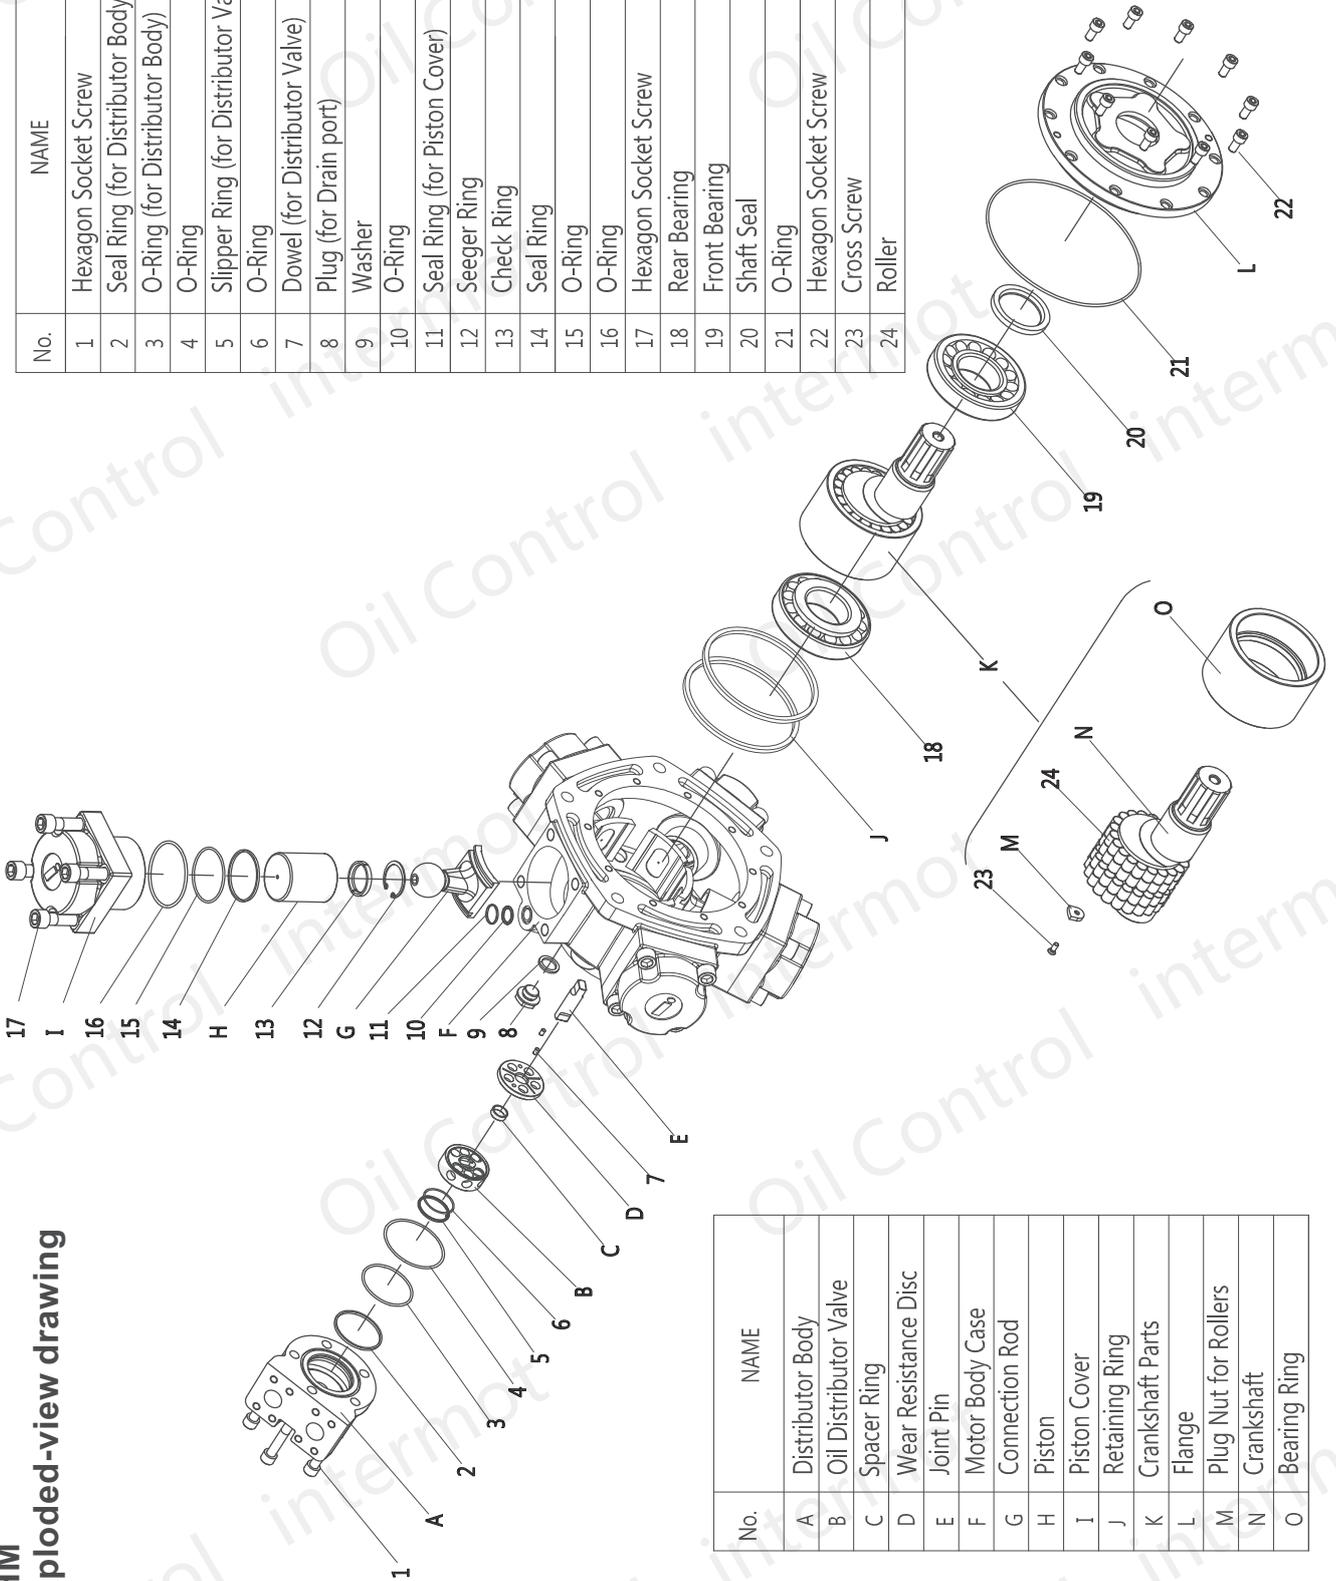

\*In case of long hour continuous working of the motor at a high speed condition, oil distributor with fushing settings is recommended, or consult our engineer for more details.

\*Various options of distributors can be applied to the different models of the series according to the actual application requirements, for more information please consult our engineer.
